Engineered Protective Coatings Secures Growth Investment

EPC Announces Completion of Private Capital Investment to Fuel Growth and Monetize Intellectual Property

Santa Fe, New Mexico, October 1, 2024—Engineered Protective Coatings LLC (“EPC”) today announced the successful closing of a private capital investment to support its strategic growth and commercialization initiatives. The funding will accelerate the Company’s ability to develop and bring to market a new generation of high-performance, eco- and bio-friendly coatings based on its recently acquired portfolio of proprietary formulas.

Following the acquisition of an extensive catalog of coating and surface treatment technologies, EPC sought additional capital to manufacture and scale complete, market-ready solutions. The majority of these water-based formulations are non-toxic, low-to-zero VOC, and applicable across multiple industries and market segments.

“Our vision is rooted in the global demand for safer, more sustainable alternatives to traditional coatings,” said Paul Andrus, Managing Director of EPC. “This funding empowers us to bring innovative products to market that address toxicity issues in the coatings industry while delivering superior performance.”

Traditional coatings often rely on petrochemical based formulations that release harmful Volatile Organic Compounds (VOCs), posing risks to both applicators and building occupants. EPC’s new line of coatings aims to eliminate these risks without compromising effectiveness. Andrus added, “We’re proud to be advancing protection and safety—without pollution.”

The capital infusion will support ongoing R&D and the launch of breakthrough products in the anti-slip, sealer, and protective treatment categories. By partnering with manufacturers, distributors, and end-users, EPC continues to deliver environmentally responsible solutions that solve real-world challenges while enhancing operational efficiency and competitiveness.
